BAJAI's On-Line Activity Management Solution
for Community Access Computers

BajEye provides the most advanced On-Line Activity Management solutions for community accessible computers that connect to the Internet. BajEye is NOT a text filter. It uses the same advanced image and Internet classification technologies used in BAJAI's Enterprise Server products. BajEye runs on each computer to perform Internet Content Categorization, Image Analysis and Filtering. This allows you to implement Internet Chaperoning, Parental Controls, Web Blocking and optional Internet Usage Monitoring.

BajEye helps Community site administrators implement Computer Use Policies. BajEye forms a part of the necessary 'risk management activities' that help Community sites meet their moral and legal 'duty of care' obligations. Once installed, BajEye is tamper resistant and requires no further administration.

KEY FEATURES AND BENEFITS

BajEye is NOT a Text Filter. BajEye Uses Artificial Intelligence Software.

BajEye uses Artificial Intelligence, Computer Vision and Advanced Heuristic Algorithms. iajaBot™ software robots scan the Internet and employ OCULAR™, a patent pending Internet classification technology. Web sites are classified into 32 categories in the BAJAI List, which is based on image and text content, link relationships and meta tags. Text filters are NOT accurate and human classifiers have human limitations. The BAJAI List is the foundation for On-Line Activity Management.

BAJAI Content Categorization List

BajEye uses the BAJAI List to accurately manage On-Line Activity. The BAJAI List is rated by the U.S. Edelman and the European NetProtect tests as the most accurate classification product in the industry, approaching 97% accuracy while the closest competitor has only managed 77% accuracy. BajEye achieves this through patented "On-the-Fly" image scanning technology, and robotic Internet classification technologies.

On-the-Fly Image Analysis

The Internet is always changing, which can make any web classification list outdated. "On-the-Fly" image scanning lets BajEye analyze images that come from unclassified sites. If they are determined to be offensive, they are not displayed in the web browser. The technology is so advanced, it will not noticeably slow down the Internet experience.

WhiteList & BlackList

In addition to the BAJAI List, you can further manage On-Line Activities through your own WhiteList and BlackList of web sites. You choose to allow or deny access with them. You can also choose to only use your WhiteList.

Spyware, Malicious Code & File Type Blocking

Manage the type of files that are loaded from the Internet onto a computer. Whether it is excessively large multimedia files or potential viruses and harmful files, BajEye helps safeguard your computers and your User Community.

Incoming & Outgoing Chat String Blocking, Chat and Adult Newsgroup Blocking

Protect your User Community by safeguarding their personal information from potential Internet Predators. BajEye can block objectionable language in incoming and outgoing Chat messages. BajEye can block access to adult newsgroups, as well as chat protocols such as AOL Instant Messaging, IRC, MS Messenger, and ICQ.

Quick and Easy Setup and Configuration, Tamper Resistant

Built with an intuitive management interface, BajEye installs in minutes and can be configured with a few mouse clicks. No further administration is required. BajEye cannot be disabled or altered without Administrative privileges. Multiple levels of administrative privileges allows librarians and other computer managers to turn BajEye on or off, depending on the client's needs, without full administrative access. Public terminal mode resets the computer to default settings.

Minimum System Requirements
486 or greater microprocessor
Windows 95 or greater operating system
Approximately 20MB of hard disk space
Approxiamtely 300 kbytes of RAM
Any Browser, Any Internet connection speed
